

I'll provide a sample report for the students based on the provided data. Please note that I'll be generating a text-based report, and you can use a library like `fpdf` in Python to convert this report into a PDF.

Here's a sample report:

****Student Report****

****Student Information:****

- * Name: Gauri
- * Email: gauri@gmail.com
- * Phone: 1234567891
- * Parent Name: Pandu
- * Parent Phone: 1234567891
- * Grade: 10
- * Subjects: Physics, Maths, Chemistry
- * Admission ID: 94c0dc1f-d98c-4517-aea9-2a0f8b32a838
- * Fees: Total - 25000, Paid - 25000, Due - 0

****Attendance:****

- * Total Attendance: 56%
- * Present: 23 times
- * Late: 10 times
- * Absent: 7 times

****Exam Results:****

- * Unit Test 1 — Mathematics: 45/50
- * Mid Term — Physics: 82/100

****Invoice Details:****

- * Invoice No: INV-2024-001

* Invoice Date: 2024-06-01

* Amount: 48000

* Paid: 48000

* Status: PAID

****Recommendations:****

* Improve attendance to achieve better academic results.

* Focus on weak subjects to improve overall performance.

Here's a Python code snippet using `fpdf` library to generate a PDF report:

```
```python
from fpdf import FPDF

class StudentReport:
 def __init__(self, student_data):
 self.student_data = student_data

 def generate_report(self):
 pdf = FPDF()
 pdf.add_page()
 pdf.set_font("Arial", size=15)

 pdf.cell(200, 10, txt="Student Report", ln=True, align='C')

 pdf.set_font("Arial", size=12)
 pdf.cell(200, 10, txt="Student Information:", ln=True, align='L')
 pdf.cell(200, 10, txt=f"Name: {self.student_data['name']}", ln=True, align='L')
 pdf.cell(200, 10, txt=f"Email: {self.student_data['email']}", ln=True, align='L')
 pdf.cell(200, 10, txt=f"Phone: {self.student_data['phone']}", ln=True, align='L')

 pdf.cell(200, 10, txt="Attendance:", ln=True, align='L')
```
```

```
pdf.cell(200, 10, txt=f"Total Attendance: {self.student_data['attendance_percentage']}%", ln=True, align='L')
```

```
pdf.cell(200, 10, txt=f"Present: {self.student_data['present']}", ln=True, align='L')
```

```
pdf.cell(200, 10, txt=f"Late: {self.student_data['late']}", ln=True, align='L')
```

```
pdf.cell(200, 10, txt=f"Absent: {self.student_data['absent']}", ln=True, align='L')
```

```
pdf.cell(200, 10, txt="Exam Results:", ln=True, align='L')
```

```
for exam in self.student_data['exams']:
```

```
pdf.cell(200, 10, txt=f"{exam['name']}: {exam['marks']}/{exam['max_marks']}", ln=True, align='L')
```

```
pdf.cell(200, 10, txt="Invoice Details:", ln=True, align='L')
```

```
for invoice in self.student_data['invoices']:
```

```
pdf.cell(200, 10, txt=f"Invoice No: {invoice['invoice_no']}", ln=True, align='L')
```

```
pdf.cell(200, 10, txt=f"Invoice Date: {invoice['invoice_date']}", ln=True, align='L')
```

```
pdf.cell(200, 10, txt=f"Amount: {invoice['amount']}", ln=True, align='L')
```

```
pdf.cell(200, 10, txt="Recommendations:", ln=True, align='L')
```

```
for recommendation in self.student_data['recommendations']:
```

```
pdf.cell(200, 10, txt=recommendation, ln=True, align='L')
```

```
pdf.output("student_report.pdf")
```

```
# Example usage:
```

```
student_data = {
```

```
'name': 'Gauri',
```

```
'email': 'gauri@gmail.com',
```

```
'phone': '1234567891',
```

```
'attendance_percentage': 56,
```

```
'present': 23,
```

```
'late': 10,
```

```
'absent': 7,
```

```
'exams': [
```

```
{'name': 'Unit Test 1 — Mathematics', 'marks': 45, 'max_marks': 50},  
{'name': 'Mid Term — Physics', 'marks': 82, 'max_marks': 100}  
  
],  
  
'invoices': [  
  
{'invoice_no': 'INV-2024-001', 'invoice_date': '2024-06-01', 'amount': 48000}  
  
],  
  
'recommendations': [  
  
'Improve attendance to achieve better academic results.',  
  
'Focus on weak subjects to improve overall performance.'  
  
]  
  
}
```

```
report = StudentReport(student_data)  
report.generate_report()  
...
```

This code generates a PDF report with the student's information, attendance, exam results, invoice details, and recommendations. You can customize the report as per your requirements.
